mzDB: Mass Spectrometry SQLite Database

Status of This Document

This document presents the completed 0.5 specification for the mzDB (Mass Spectrometry SQLite Database) data format developed by the Proteomics French Infrastructure (ProFI). Distribution is unlimited.

Version of This Document

The current version of this document is: Version 0.5.0.0; June 3, 2013.

The version of this document matches the format version with one trailing decimal point and integer to denote specification documentation updates that do not correspond to a format update. Thus the version numbers correspond to:

major Version. minor Version. maintenance Version. documentation Only Update Version.

1. Introduction

1.1 Background

Mass spectrometry is a popular method to analyse bio-molecules by measuring the intact mass-to-charge ratios of their in-situ generated ionised forms or the mass-to-charge ratios of in-situ-generated fragments of these ions. The resulting mass spectra are used for a variety of purposes, among which is the identification, characterization, and absolute or relative quantification of the analysed molecules. The processing steps to achieve these goals typically involve semi-automatic computational analysis of the recorded mass spectra and sometimes also of the associated metadata (e.g., elution characteristics if the instrument is coupled to a chromatography system). The result of the processing can be assigned a score, rank or confidence measure.

Differences inherent in the use of a variety of instruments, different experimental conditions under which analyses are performed, and potential automatic data preprocessing steps by the instrument software can influence the actual measurements and therefore the results after processing. Additionally, most instruments output their acquired data in a very specific and often proprietary format. These proprietary formats are then typically transformed into so-called peak lists to be analysed by identification and characterisation software. Data reduction such as peak centroiding and deisotoping is often performed during this transformation from proprietary formats to peak lists. In addition, these peak list file formats lack information about the precursor MS signals and about the associated metadata (i.e., instrument settings and description, acquisition mode, etc) compared to the files they were derived from. The peak lists are then used as inputs for subsequent analysis. The many different and often proprietary formats make integration or comparison of mass spectrometer output data difficult or impossible, and the use of the heavily processed and data-poor peak lists is often suboptimal.

This document addresses this problem with the presentation of the mzDB SQLite format, which is designed to hold the data output of a mass spectrometer as well as a systematic description of the conditions under which this data was acquired and transformed. The following target objectives can be defined for the format:

- T1. The discovery of relevant results, so that, for example, data sets in a database or public repository that use a particular technique or combination of techniques can be identified and studied by experimentalists during experiment design or data analysis.
- T2. The sharing of best practice, whereby, for example, approaches that have been successful at analysing low abundance analytes can be captured alongside the results produced.
- T3. The evaluation of results, whereby, for example, the number and quality of the spectra recorded from a sample can be assessed in the light of the experimental conditions.
- T4. The sharing of data sets, so that, for example, public repositories can import or export data, multi-site projects can share results to support integrated analysis, or meta-analyses can be performed by third parties from previously published data.
- T5. The most comprehensive support of the instruments output, so that data can be captured in profile mode, centroid mode, and other relevant forms of biomolecular mass spectrometry data representation
- T6. The efficient processing of MS data, by leveraging the multiple indexing strategies that are provided.

The presented format is an interesting alternative to mzML for the long-term archiving, sharing and fast processing of mass spectrometry data.

The description of mass spectrometry data output and its experimental context requires that models include: (i) the actual data acquired, to a sufficient precision, as well as its associated metadata; and (ii) an adequate description of the instrument characteristics, its configuration and possible preprocessing steps applied. This document details both these parts, as they are required to support the tasks T1 to T6 above.

This document defines a specification and is not a tutorial. As such, the presentation of technical details is deliberately direct. The role of the text is to describe the format model and justify design decisions made. This document does not provide comprehensive examples of the format in use.

Example documents are provided separately and should be examined in conjunction with this document. It is anticipated that tutorial material will be developed in the future to aid implementation. Although the present specification document describes constraints and guidelines related to the mzDB format content as well as the availability of tools helping to read and write mzDB files, it does not describe any implementation constraints or specifications such as coding language or operating system for software that will generate and/or read mzDB data.

1.2 Previous formats

During 2003 – 2005, two data formats to store mass spectrometer output in an open, vendor-neutral, XML format were developed. The mzData format [mzData] was developed by the PSI, primarily as a data exchange and archive format. The mzXML format [mzXML] was developed at the Institute for Systems Biology (ISB), primarily in order to streamline data processing software. Both formats are used extensively but it has been noted that having two formats for essentially the same information causes unnecessary confusion in the community and adds complexity to software developers as often both formats must be supported. Therefore the designers of mzData and mzXML, including representatives of instrument vendors, analysis software developers and end users, have joined under the auspices of the PSI and jointly developed a single format intended to replace the previous two: the mzML format.

The main challenge in uniting the mzData and mzXML formats was indeed resolving the opposing philosophies rather than fundamental technical issues. On the contrary, the mzDB format is a radical technical change because it is no more based on the eXtendedMarkup Language but on the SQLite data format. The latter is used in many computational projects (http://www.sqlite.org/famous.html) and compatible with most programming languages. mzDB has an internal data structure allowing it to achieve efficient queries in both time and m/z dimensions. This makes it particularly suitable for the processing of LC-MS data.

1.3 Design Philosophy

Since the mzML format is the official PSI standard for mass spectrometry data representation, we decided to design mzDB in order to have a semantic and a data structure as close as possible to the mzML ones. We also kept some design principles that guided the mzML development including some disgressions:

- 1. Keep the format simple. Metadata representation is as simple as in an mzML document. However the MS data structure of mzDB is a little bit more complex because peaks are stored into bounding boxes (see section X.X) instead of full scan records.
- 2. *Minimize alternate ways of encoding the same information*. Such flexibility, while sometimes touted as a benefit for some products, is bad for data formats.
- 3. Build in some flexibility for encoding new important information but keep the format stable. There is a strong desire from companies that develop software for their customers to keep the data format stable over long periods of time with updates to an auxiliary file.

It should be noted that beyond these principles the main design goal of the mzDB was to obtain an efficient and compact data format leveraging multiple indexing strategies.

There was great temptation to optimize the compactness of metadata. There are many enhancements that have been suggested, but we decided to keep a strong compatibility with the mzML syntax. The enhancements not considered compatible with this goal may be entertained for a future version of mzDB.

The remainder of this document is structured as follows. Section 2.1 describes a number of concepts and information about the implementation of mzDB, including aspects of terminology, design issues, the controlled vocabulary, etc. The SQL schema is presented in Section 3; The XML schemata are presented in Section 4; Some conclusions are presented in Section 5.

2. Implementation of the Format

2.1 Concepts and Terminology

This document assumes familiarity with SQL and XML data modelling. The main mzDB structure is described using a relational model. Metadata are described using XML schema (www.w3.org/XML/Schema).

The keywords "MUST," "MUST NOT," "REQUIRED," "SHALL," "SHALL NOT," "SHOULD," "SHOULD," "SHOULD," "MAY," and "OPTIONAL" are to be interpreted as described in RFC-2119 (Bradner 1997).

2.2 The PSI Mass Spectrometry Controlled Vocabulary (CV)

A comprehensive collection of terms have been defined (mostly extracted from vocabulary and definitions in chapter 12 of the IUPAC nomenclature book) and structured in an mzML-friendly way, hopefully facilitating the browsing of the terms. Almost all first-level branch terms (the direct children of the root term) have a homonymous XML element in mzML. Their children, the second-level terms, are relevant topics or categories which need CV support for their description. The leaf nodes under their respective parent categories should be used in a cvParam under the appropriate XML element in mzML schema.

Some terms describe attributes that must be coupled with a numerical value attribute in the CvParam element (e.g. dwell time MS:1000039) and optionally a unit for that value (e.g. second MS:1000502). The terms that require a value are denoted by having a "datatype" key-value pair in the CV itself; the use of the 'object attribute' (MS:1000547) term to denote this is now deprecated. Similarly, terms that need to be qualified with units are denoted by have a "needs_units" key in the CV itself.

As recommended by the PSI CV guidelines, psi-ms.obo should be dynamically maintained via the psidev-ms-vocab mailing lists that allow any user to request new terms in agreement with the community involved. Once a consensus is reached among the community the new terms are added within few days. If there is no obvious consensus, the CV coordinators committee should vote and make a decision. A new psi-ms.obo should then be released by updating the file on the CVS server without changing the name of the file (this would alter the propagation of the file to the OBO website and to other ontology services that rely on file stable URI). For this reason an internal version number with two decimals (x.y.z) should be increased:

- x should be increased when a first level term are renamed added deleted or rearranged in the structure. Such rearrangement is supposed to be rare and is very likely to have repercussion on the mapping.
- y should be increased when any other term except the first level one is altered.
- z should be increased when there is no term addition or deletion but just editing on the definitions or other minor changes.

It was decided that the CV not contain "unknown" terms as much as possible, thus there is no "unknown instrument", etc. There are two cases where it is tempting to use unknown:

- 1) The information is really known, but none of the existing terms fit. In this case, instead of choosing "unknown", a user should send email to the psidev-ms-vocab list proposing a new term. The CV committee should approve and add the desired term, or point out an existing synonym that should be used. Then once the term has been assigned an accession number and official name, then the user should begin using that.
- 2) The second case is there the information is truly not known. We want to avoid cases where the user picks something just to appease a validator. In this case, the use of the base class is recommended, e.g.:

```
<instrumentConfiguration id="unknownInstrument">
```

<cvParam cvRef="MS" accession="MS:1000031" name="instrument model"/>

</instrumentConfiguration>

The rationale is that the most specific information available is provided, i.e. that a mass spectrometer of some model generated the data, but it is not known which one. This also avoids the situation where the tags are optional. If optional tags are not provided, it is never clear whether

the information is truly unknown, or the writer simple forgot to write the information or was too lazy to write the information.

In the above example, if the writer knows that the instrument was one from a specific vendor, but not the model, then the vendor model term should be used instead of the completely generic "instrument model".

To obsolete a term, the following must be done:

- Put OBSOLETE at the beginning of the definition
- · Add a comment to the term describing the reason for obsoleting.
- Set the OBO-format is obsolete tag to true

This is a summary of the procedure given in http://psidev.info/files/CommunityPractice-revised.doc.

If a term name needs to be changed, the accession number should stay the same and the term name simply changed. One should NOT obsolete the term and create a new one with the revised name.

The following ontologies or controlled vocabularies specified below may also be suitable or required in certain instances:

- Unit Ontology (http://www.obofoundry.org/cgi-bin/detail.cgi?id=unit)
- ChEBI (http://www.ebi.ac.uk/chebi/)
- OBI (Ontology of Biological Investigations http://obi.sourceforge.net/) (formerly called FuGO)

2.3 Conventions

Date timestamps must be encoded as in the ISO-8601 specification (http://www.w3.org/TR/NOTE-datetime) such as 2007-06-27T15:23:45.00035.

Metadata (XML parameter tree) designs follow the principles detailed in the mzML specifications.

2.4 Other supporting materials

This document cannot be fully judged on its own. It is important to study the accompanying sample instance documents, controlled vocabulary, schema files, and the software that implements this version of mzDB.

All these files and programs are available at: http://github.com/mzdb

They are:

Filename	Description
mzDB_0.5.0.architect	The database diagram in the Power Architect format
mzDB_0.5.0.sql	The database SQL script
mzDB_0.5.0.html	HTML documentation of the database schema

2.5 Open Issues

We note that usage of JSON was considered and rejected for the representation of metadata in the current version of mzDB. It remains a possibility that metadata of mzDB 2.0 will be stored using JSON.

2.6 Comments on Specific Use Cases

As for mzML, many special use cases were considered during the development of mzDB. Most of these use cases have a corresponding example file that exercise the relevant part of the schema and

provide a reference implementation example. Authors of mzDB writing software are encouraged to examine the examples that accompany this format release before implementing the writer. In the subsections below, we comment on a few of the notable use cases that were considered.

2.6.1 Selected Reaction Monitoring (SRM)

There was considerable discussion on how to encode SRM experiments. There seem to be two major contenders: encoding them as tiny MS/MS-like spectra; or encoding them directly as complete chromatograms. We decided to follow the mzML specifications namely encode each SRM scan as a mini MS/MS-like spectra with a precursor corresponding to the Q1 m/z and a small spectrum encoding one or more Q3 m/z values that correspond to the Q1 m/z. We note that these mini scans may be a single (centroided) value per Q3 m/z, or the mini scans may be profile mode scans surrounding the Q3 m/z. For example, it is entirely permissible to monitor two Q3 m/z values for a single Q1 m/z, and encode profile mode scans for both Q3 regions in a single spectrum.

The mzDB format also contains a "chromatogram" table that is capable of containing a full description of and the data for a chromatogram. The chromatogram may be simply be a total ion current (TIC) chromatogram of an ordinary MS1 or MS/MS run, or a chromatogram corresponding to a Q1,Q3 pair in a SRM run.

It has been resolved that all SRM runs must be encoded as mini MS/MS-like spectra using the "scan" table. Optionally, the same information may also be encoded using the "chromatogram" table as a speed-enhancing feature. At present, it has been decided that SRM output may not be encoded *only* in the "chromatogram" form. The goal is to avoid having two different ways of encoding the same data. Readers can always count on the mini MS/MS-like spectra and may only optionally support the "chromatogram" constructs. This is merely a policy decision, not one dictated by the schema.

Note: SRM is often referred to as multiple reaction monitoring (MRM), but that term is an obsolete synonym of SRM according to IUPAC.

2.6.2 Profile (continuous) spectra vs. centroided (peak list) (peak picked) spectra vs. fitted (parameterized peaks) spectra

Mass spectra typically come in two major flavors: profile and centroided. Profile spectra represent the scanned data in a (sometimes only approximately) regularly spaced format, sometimes with gaps. Centroided spectra present the scanned data only by specifying the location and intensity of individual detected peaks, usually after subjecting the profile spectrum to a peak-picking algorithm. We have added a third mode of data representation obtained after processing by a peak-fitting algorithm: the fitted mode. The latter present the scanned data by specifying the location and intensity of individual detected peaks along with the left and right HWHMs (Half Width at Half-Maximum) of these peaks.

The mzDB format can encode either format with the specification of the used mode (using the data_encoding table). However, it is not allowed to encode the same spectrum using different modes in the same file. The recommended workflow if both spectra are desired is to encode the profile spectra in one file and the processed data in a second file (with appropriate annotations as to what was done). It is permissible to have some spectra in one mode and different ones in another; for example MS level 1 spectra may be profile mode, while MS level 2 spectra may be peak picked in the same file.

3. Database schema

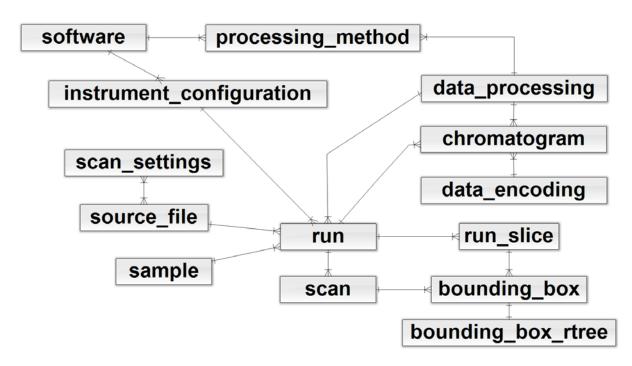

Figure 1: partial ER (Entity-relationship) diagram of the mzDB format. Each box represents a database table. Some tables related to metadata were voluntarily not shown for the sake of clarity.

Below is appended the full HTML documentation of the database schema. Tables are presented in ascendant alphabetical order.

3.1 **bounding_box**

The Bounding Box (BB) table aims to store a region of the run. A BB refers to a run slice which describes the m/z width of this BB. The first and last scan id describe the height in time dimension of the BB. Data points may be accumulated in m/z and time dimensions. In the simplest case a BB may store peaks of a full MS spectrum, implying that first and last scans correspond to the same record.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
id (PK)	id	INTEGER	PK	NOT NULL
Automatically incremented primary	key.			
data	data	BLOB		NOT NULL
A BLOB containing the data points table).	using a given structure representation	(see data_encond	ing	
run_slice_id (<u>FK</u>)	run_slice_id	INTEGER		NOT NULL
A reference to the corresponding ru	n_slice.			
first_spectrum_id (FK)	first_spectrum_id	INTEGER		NOT NULL
A reference to the first spectrum of	the BB.			
last_spectrum_id (<u>FK</u>)	last_spectrum_id	INTEGER		NOT NULL
A reference to the last spectrum of	the BB.			

References

- <u>spectrum</u> through (first_spectrum_id)
- spectrum through (last_spectrum_id)

• <u>run_slice</u> through (run_slice_id)

Referenced By

• <u>bounding box rtree</u> referencing (id)

3.2 **bounding_box_rtree**

A virtual table used to index the bounding boxes with the help of a R*Tree structure automatically generated by SQLite. For more detailled information see http://www.sqlite.org/rtree.html.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
id (PK) (<u>FK</u>)	id	INTEGER	PK	NOT NULL
The indentifier of the bounding	box that corresponds to this index.			
min_mz	min_mz	REAL		NOT NULL
Minimum m/z of the correspond	ling BB.			
max_mz	max_mz	REAL		NOT NULL
Maximum m/z of the correspon	ding BB.			
min_time	min_time	REAL		NOT NULL
Minimum time of the correspon	ding BB.			
max_time	max_time	REAL		NOT NULL
Maximum time of the correspor	nding BB.			

References

• <u>bounding_box</u> through (id)

3.3 chromatogram

A chromatogram may be simply be a total ion current (TIC) chromatogram of an ordinary MS1 or MS/MS run, or a chromatogram corresponding to a Q1,Q3 pair in a SRM run.

Logical Column Name	Physical Column Name	Туре	PK	Nullable	
id (PK)	id	INTEGER	PK	NOT NULL	
Automatically incremented primary key	/.				
name	name	VARCHAR(0)		NOT NULL	
A unique name for this chromatogram. Examples: sic, tic, ms1_tic, ms2_tic, bpc, transition_xxx_xxx					
activation_type	activation_type	VARCHAR(10)		NOT NULL	
The type of activation used for fragmentation. This field stores only a 3 letters label (e.g. CID, ETD, HCD), but more detailled information could be provided using the param_tree field.					
data_points	data_points	BLOB		NOT NULL	
A BLOB containing the data points usi	ng a given data representation (s	see data_enconding tab	ole).		
param_tree	param_tree	CLOB		NOT NULL	
This field must contain the table cvPar specifications).	ams and userParams as an XML	string (see XML schen	na		
precursor	precursor	CLOB			
This field can contain optionally an XML string describing the method of precursor ion selection and activation (see XML schema specifications).					
product	product	CLOB			
This field can contain optionally an XML string describing the method of product ion selection and					

activation in a precursor ion scan (see XML schema specifications).

shared_param_tree_id (FK)	shared_param_tree_id	INTEGER	
An optional reference to a shared cvParams.	d_param_tree, which is a reusable	container of one or more	
run_id (<u>FK</u>)	run_id	INTEGER	NOT NULL
This field must reference the 'id'	of the corresponding run.		
data_processing_id (FK)	data_processing_id	INTEGER	
This field can optionally reference	e the 'id' of the appropriate data_p	rocessing.	
data_encoding_id (FK)	data_encoding_id	INTEGER	NOT NULL
This field must reference the 'id'	of the appropriate data encoding		

This field must reference the 'id' of the appropriate data_encoding.

References

- <u>run</u> through (run_id)
- <u>data_encoding</u> through (data_encoding_id)
- <u>shared_param_tree</u> through (shared_param_tree_id)
- <u>data_processing</u> through (data_processing_id)

3.4 **cv**

Information about an ontology or CV source and a short 'lookup' tag to refer to.

Logical Column Name	Physical Column Name	Туре	PK	Nullable	
id (PK)	id	VARCHAR(10)	PK	NOT NULL	
The short label to be used as a reference tag with which to refer to this particular Controlled Vocabulary source description.					
full_name	full_name	VARCHAR(0)		NOT NULL	
The usual name for the reso	urce (e.g. The PSI-MS Controlled	l Vocabulary).			
version	version	VARCHAR(10)			
The version of the CV from v	which the referred-to terms are dra	awn.			
uri	uri	VARCHAR(0)		NOT NULL	
The URI for the resource.					

Referenced By

- <u>cv unit</u> referencing (id)
- <u>cv term</u> referencing (id)

3.5 **cv_term**

This table lists the CV terms used in the mzDB file.

Logical Column Name	Physical Column Name	Туре	PK	Nullable	
accession (PK)	accession	VARCHAR(0)	PK	NOT NULL	
The accession number of the r	referred-to term in the named res	ource (e.g.: MS:000012).			
name	name	VARCHAR(0)		NOT NULL	
The actual name for the parameter, from the referred-to controlled vocabulary. This should be the preferred name associated with the specified accession number.					
unit_accession (FK)	unit_accession	VARCHAR(0)			
This field can optionally reference the CV accession number of the appropriate unit.					
Time meral carr optionally refere		по арргорнаю апт.			

This field must reference the 'id' of the corresponding CV resource.

References

- cv through (cv_id)
- cv unit through (unit_accession)

3.6 **cv_unit**

This table lists the CV units used in the mzDB file.

Logical Column Name	Physical Column Name	Туре	PK	Nullable		
accession (PK)	accession	VARCHAR(0)	PK	NOT NULL		
The unit accession number (e.g	The unit accession number (e.g., 'UO:0000266' for 'electron volt').					
name	name	VARCHAR(0)		NOT NULL		
The unit name (e.g., 'electron volt' for 'UO:0000266').						
cv_id (<u>FK</u>)	cv_id	VARCHAR(10)		NOT NULL		

This field must reference the 'id' of the corresponding CV resource.

References

• <u>cv</u> through (cv_id)

Referenced By

- <u>cv term</u> referencing (accession)
- <u>user term</u> referencing (accession)

3.7 data_encoding

Describes data encoding parameters used for data points storage.

Logical Column Name	Physical Column Name	Туре	PK	Nullable		
id (PK)	id	INTEGER	PK	NOT NULL		
Automatically incremented p	orimary key.					
mode	mode	VARCHAR(10)		NOT NULL		
Signal can be stored using 3 different modes: profile, centroided, fitted. Profile mode represent the scanned data in a (sometimes only approximately) regularly spaced format, sometimes with gaps. Centroided mode present the scanned data only by specifying the location and intensity of individual detected peaks. Fitted mode is an enhencement of the centroided mode with additional information for each detected peak such as the left and right HWHMs.						
compression	compression	VARCHAR(0)				
This field provides optionally	the name of the algorithm used	for data compression (e.g.	zlib, Izma	.).		
byte_order	byte_order	VARCHAR(13)		NOT NULL		
The byte order used for data	a encoding: little_endian or big_e	ndian.				
param_tree	param_tree	CLOB		NOT NULL		
specifications).	able cvParams and userParams and userParams and userParams and userParams and used for each data point.					

Referenced By

• <u>spectrum</u> referencing (id)

• <u>chromatogram</u> referencing (id)

3.8 data_processing

Description of the way in which particular software were used. Variable methods should be described in the appropriate acquisition section - if no acquisition-specific details are found, then this information serves as the default.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
id (PK)	id	INTEGER	PK	NOT NULL
Automatically incremented p	orimary key.			
name	name	VARCHAR(0)		NOT NULL
A unique name for this data	processing.			

Referenced By

- <u>processing method</u> referencing (id)
- spectrum referencing (id)
- <u>run</u> referencing (id)
- <u>run</u> referencing (id)
- <u>chromatogram</u> referencing (id)

3.9 instrument_configuration

Description of a particular hardware configuration of a mass spectrometer. Each configuration must have one (and only one) of the three different components used for an analysis. For hybrid instruments, such as an LTQ-FT, there must be one configuration for each permutation of the components that is used in the document.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
id (PK)	id	INTEGER	PK	NOT NULL
Automatically incremented primary ke	ey.			
name	name	VARCHAR(0)		NOT NULL
A unique name for this instrument con	nfiguration.			
param_tree	param_tree	CLOB		NOT NULL
This field must contain the table cvPa specifications).	rams and userParams as an X	ML string (see XML so	chema	
component_list	component_list	CLOB		NOT NULL
This field must contain the componen	tList as an XML string (see XM	L schema specificatio	ns).	
shared_param_tree_id (FK)	shared_param_tree_id	INTEGER		
An optional reference to a shared_pacvParams.	ram_tree, which is a reusable o	container of one or mo	re	
software_id (<u>FK</u>)	software_id	INTEGER		NOT NULL
This field must be used to reference t	he 'id' of the appropriate softwa	ire.		

References

- <u>software</u> through (software_id)
- <u>shared_param_tree</u> through (shared_param_tree_id)

Referenced By

- <u>run</u> referencing (id)
- spectrum referencing (id)

3.10 **mzdb**

Information pertaining to the entire mzDB file (i.e. not specific to any part of the data set) is stored here.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
version (PK)	version	VARCHAR(10)	PK	NOT NULL
The version of the mzDB forma majorVersion.minorVersion.ma				
creation_timestamp	creation_timestamp	VARCHAR(0)		NOT NULL
The creation date of the mzDB	file in the ISO-8601 notation (e.	g. 2007-06-27T15:23:45.0	0035).	
file_content	file_content	CLOB		NOT NULL
This field must contain the fileC	content as an XML string (see X	ML schema specifications)		
contact	contact	CLOB		NOT NULL
This field must contain the cont	acts as an XML string (see XML	schema specifications).		
param_tree	param_tree	CLOB		NOT NULL
This field must contain the table specifications). These user para BB_width_ms1, BB_width_msn	•	• .	schema	

3.11 param_tree_schema

Each record describes the schema of the params that can be set in the param_tree column of the corresponding table or in the data column of the shared_param_tree table. This schema can then be used by the client application to validate the data structure to be stored.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
name (PK)	name	VARCHAR(0)	PK	NOT NULL
The name of the schema.				
type	type	VARCHAR(10)		NOT NULL
The serialization format used supported.	d for param tree data. May be XS	D or JSON, but only XSD is	s currently	
schema	schema	CLOB		NOT NULL
This field was a section the sec				

This field must contain the schema of the corresponding param_tree.

Referenced By

- shared param tree referencing (name)
- <u>table param tree schema</u> referencing (name)

3.12 processing_method

Description of the way in which a particular software was used. The default peak processing method describes the base method used in the generation of a particular mzML file. Variable methods should be described in the appropriate acquisition section - if no acquisition-specific details are found, then this information serves as the default.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
id (PK)	id	INTEGER	PK	NOT NULL

Automatically incremented primary key.

order	order	INTEGER	NOT NULL
This field allows a series of consecutive Processing methods are ordered a	cutive steps to be placed in the corre across all data processings.	ct order.	
param_tree	param_tree	CLOB	NOT NULL
This field must contain the table cyspecifications).	/Params and userParams as an XMI	_ string (see XML schem	na
shared_param_tree_id (FK)	shared_param_tree_id	INTEGER	
An optional reference to a shared_cvParams.	_param_tree, which is a reusable cor	ntainer of one or more	
data_processing_id (FK)	data_processing_id	INTEGER	NOT NULL
This field must reference the 'id' of	the corresponding data processing.		
software_id (<u>FK</u>)	software_id	INTEGER	NOT NULL
This field must reference the 'id' of	the appropriate software.		

References

- <u>software</u> through (software_id)
- <u>shared_param_tree</u> through (shared_param_tree_id)
- <u>data_processing</u> through (data_processing_id)

3.13 **run**

A run in mzDB should correspond to a coherent set of spectra acquired on an instrument.

Logical Column Name	Physical Column Name	Туре Г	PK	Nullable
id (PK)	id	INTEGER F	PK	NOT NULL
Automatically incremented primary key.				
name	name	VARCHAR(0)		NOT NULL
A unique name for this run.				
start_timestamp	start_timestamp	VARCHAR(0)		
The optional start timestamp of the run in	the ISO-8601 notation (e.g. 2007-0	6-27T15:23:45.000	35).	
param_tree	param_tree	CLOB		
This field can contain optionally the table schema specifications).	cvParams and userParams as an X	ML string (see XML	-	
shared_param_tree_id (<u>FK</u>)	shared_param_tree_id	INTEGER		
An optional reference to a shared_param cvParams.	_tree, which is a reusable container	of one or more		
sample_id (<u>FK</u>)	sample_id	INTEGER		
This field must reference the 'id' of the ap	propriate sample.			
default_instrument_config_id (FK)	default_instrument_config_id	INTEGER		NOT NULL
This field MUST reference the 'id' of the direference an instrument configuration, it is		scan does not		
default_source_file_id (FK)	default_source_file_id	INTEGER		
This field can optionally reference the 'id' reference a source file and this field is se	•		ot	
default_scan_processing_id (FK)	default_scan_processing_id	INTEGER		NOT NULL
This field MUST reference the 'id' of the d not reference any data processing, it impl because the minimum amount of data pro mzDB".	icitly refers to this data processing.	This field is required		
default_chrom_processing_id (<u>FK</u>)	default_chrom_processing_id	INTEGER		NOT NULL

This field MUST reference the 'id' of the default data processing for the chromatograms. If an

acquisition does not reference any data processing, it implicitly refers to this data processing. This field is required because the minimum amount of data processing that any format will undergo is "conversion to mzDB".

3.14 run_slice

A "run slice" is a region of the run containing MS peaks in a given m/z scan window and in the whole duration of the run.

Constraints: UNIQUE(number, ms_level)

Logical Column Name	Physical Column Name	Туре	PK	Nullable
id (PK)	id	INTEGER	PK	NOT NULL
Automatically incremented prin	mary key.			
ms_level	ms_level	INTEGER		NOT NULL
Stage of MS achieved for this run slice in a multi stage mass spectrometry experiment.				
number	number	INTEGER		NOT NULL
This field allows a series of cor	nsecutive run slices to be placed in t	the correct order.		
begin_mz	begin_mz	REAL		NOT NULL
The theoretical minimum m/z of	of the run slice.			
end_mz	end_mz	REAL		NOT NULL
The theoretical maximum m/z	of the run slice.			
param_tree	param_tree	CLOB		
This field can contain optionally the table cvParams and userParams as an XML string (see XML schema specifications).				
run_id (<u>FK</u>)	run_id	INTEGER		NOT NULL
This field was at weference the li-	all and the analysis are a second as a second			

This field must reference the 'id' of the corresponding run.

References

3.22 table_param_tree_schema

This table allows to 'logically' map a given table to its corresponding param_tree schema.

Logical Column Name	Physical Column Name	Туре	PK	Nullable
table_name (PK)	table_name	VARCHAR(0)	PK	NOT NULL
The name of the table.				
schema_name (FK)	schema_name	VARCHAR(0)		NOT NULL
The name of the schema.				

References

• <u>param_tree_schema</u> through (schema_name)

3.23 **target**

Contains the target list (or 'inclusion list') configured prior to the run.

Logical Column Name	Physical Column Name	Туре	PK	Nullable		
id (PK)	id	INTEGER	PK	NOT NULL		
Automatically incremented primary key.						
param_tree	param_tree		NOT NULL			
This field must contain the table cvParams and userParams as an XML string (see XML schema specifications).						
shared_param_tree_id (FK)	shared_param_tree_id	INTEGER				
An optional reference to a shared_paracvParams.	m_tree, which is a reusable con	tainer of one or mor	е			
scan_settings_id (FK)	scan_settings_id	INTEGER		NOT NULL		
Automatically incremented primary key.						

References

- <u>scan_settings</u> through (scan_settings_id)
- shared_param_tree through (shared_param_tree_id)

3.24 user_term

This table lists the uncontrolled user parameters used in the mzDB file.

Logical Column Name	Physical Column Name	Туре	PK	Nullable	
id (PK)	id	INTEGER	PK	NOT NULL	
Automatically incremented primary key.					
name	name	VARCHAR(0)		NOT NULL	
The unique name for the para	ameter.				
type	type	VARCHAR(0)		NOT NULL	
The datatype of the parameter	er, where appropriate (e.g.: xsd:floa	at).			
unit accession (FK)	unit accession	VARCHAR(0)			

This field can optionally reference the CV accession number of the appropriate unit.

References

• cv unit through (unit_accession)

4. Metadata XML schemata

4.1 Element <params>

Definition: A tree of CVParam and UserParam elements.

Type: dx:ParamGroupType

Subelement Name	min	max	Definition
<u>cvParam</u>	0	unlim	This element holds additional data or annotation. Only controlled values are allowed here.
<u>userParam</u>	0	unlim	Uncontrolled user parameters (essentially allowing free text). Before using these, one should verify whether there is an appropriate CV term available, and if so, use the CV term instead

Subelements:

Example Context:

```
<params>
    <cvParam cvRef="MS" accession="MS:1000133" name="collision-induced dissociation"
value=""/>
    <cvParam cvRef="MS" accession="MS:1000045" name="collision energy" value="35"
unitCvRef="U0" unitAccession="U0:0000266" unitName="electronvolt"/>
    <cvParam cvRef="MS" accession="MS:1000419" name="collision gas" value="nitrogen"/>
</params></params>
```

<cvParam cvRef="MS" accession="MS:1000579" name="MS1 spectrum" value=""/>
<cvParam cvRef="MS" accession="MS:1000130" name="positive scan" value=""/>
<cvParam cvRef="MS" accession="MS:1000580" name="MSn spectrum" value=""/>
<cvParam cvRef="MS" accession="MS:1000514" name="m/z array" unitCvRef="MS"</pre>

Example cvParams:

cvParam cvRef="MS" accession="MS:1000514" name="m/z array" unitCvRef="MS"
unitAccession="MS:1000040" unitName="m/z"/>
cvParam cvRef="MS" accession="MS:1000523" name="64-bit float"/>
cvParam cvRef="MS" accession="MS:1000523" name="no compression"/>
cvParam cvRef="MS" accession="MS:1000515" name="intensity array" unitCvRef="MS"
unitAccession="MS:1000131" unitName="number of counts"/>
cvParam cvRef="MS" accession="MS:1000521" name="32-bit float"/>
cvParam cvRef="MS" accession="MS:1000516" name="charge array"/>

```
<cvParam cvRef="MS" accession="MS:1000448" name="LTQ FT" value=""/>
<cvParam cvRef="MS" accession="MS:1000529" name="instrument serial number"
value="SN06061F"/>
<cvParam cvRef="MS" accession="MS:1000032" name="customization" value="none"/>
<cvParam cvRef="MS" accession="MS:1000133" name="collision-induced dissociation"
value=""/>
<cvParam cvRef="MS" accession="MS:1000045" name="collision energy" value="35"
unitCvRef="UO" unitAccession="UO:0000266" unitName="electronvolt"/>
<cvParam cvRef="MS" accession="MS:1000419" name="collision gas" value="nitrogen"/>
```

Notes This element is referred as param_tree in the SQL schema.

4.2 Element <fileContent>

This summarizes the different types of spectra that can be expected in the file. This is

expected to aid processing software in skipping files that do not contain appropriate spectrum types for it. It should also describe the nativeID format used in the file by

referring to an appropriate CV term.

Type: dx:ParamGroupType

Attributes: none

Definition:

Subelement Name	min	max	Definition
referenceableParamGroupRef	0	unlim	A reference to a previously defined ParamGroup, which is a reusable container of one or more cvParams.
<u>cvParam</u>	0	unlim	This element holds additional data or annotation. Only controlled values are allowed here.
<u>userParam</u>	0	unlim	Uncontrolled user parameters (essentially allowing free text). Before using these, one should verify whether there is an appropriate CV term available, and if so, use the CV term instead

MUST supply a *child* term of MS:1000792 (isolation window attribute) one or more times

e.g.: MS:1000827 (isolation window target m/z) e.g.: MS:1000828 (isolation window lower offset) e.g.: MS:1000829 (isolation window upper offset)

<cvParam cvRef="MS" accession="MS:1000827" name="isolation window target m/z"</pre>

value="445.30000000000001" unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>
<cvParam cvRef="MS" accession="MS:1000828" name="isolation window lower offset"
value="0.5" unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>

<cvParam cvRef="MS" accession="MS:1000829" name="isolation window upper offset"</pre>

value="0.5" unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"

4.16 Element <selectedIonList>

Definition: A list of ions that were selected.

Type: dx:SelectedIonListType

Attributes:

Subelements:

Attribute Name	Data Type	Use	Definition
count	xs:nonNegativeInteger	required	The number of selected precursor ions defined in this list.

Subelement Name	min	max	Definition
selectedion	1	unlim	Structure allowing the use of a controlled (cvParam) or uncontrolled vocabulary (userParam), or a reference to a predefined set of these in this mzML file (paramGroupRef).

<selectedIonList count="1">

<selectedIon>

cvParam cvRef="MS" accession="MS:1000744" name="selected ion m/z"
value="1082.5037" unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>

<cvParam cvRef="MS" accession="MS:1000633" name="possible charge state"</pre>

value="2"/>

<cvParam cvRef="MS" accession="MS:1000633" name="possible charge state"</pre>

value="3"/>

</selectedIon> </selectedIonList>

Example Context:

4.17 Element <activation>

Definition: The type and energy level used for activation.

Type: dx:ParamGroupType

Attributes: none

Subelement Name	min	max	Definition
referenceableParamGroupRef	0	unlim	A reference to a previously defined ParamGroup, which is a reusable container of one or more cvParams.
<u>cvParam</u>	0	unlim	This element holds additional data or annotation. Only controlled values are allowed here.
<u>userParam</u>	0	unlim	Uncontrolled user parameters (essentially allowing free text). Before using these, one should verify whether there is an appropriate CV term available, and if so, use the CV term instead

<activation>

Example Context:

Subelements:

<cvParam cvRef="MS" accession="MS:1000133" name="collision-induced dissociation"</pre>

<cvParam cvRef="MS" accession="MS:1000045" name="collision energy" value="35"</pre> unitCvRef="UO" unitAccession="UO:0000266" unitName="electronvolt"/>

</activation>

Path precursorList/precursor/activation

MAY supply a *child* term of MS:1000510 (precursor activation attribute) one or more times

e.g.: MS:1000045 (collision energy) e.g.: MS:1000245 (charge stripping) e.g.: MS:1000412 (buffer gas)

cvParam Mapping Rules:

e.g.: MS:1000419 (collision gas)
e.g.: MS:1000509 (activation energy)
MUST supply term MS:1000044 (dissociation method) or any of its children one or more times

e.g.: MS:1000133 (collision-induced dissociation) e.g.: MS:1000134 (plasma desorption)

e.g.: MS:1000135 (post-source decay)
e.g.: MS:1000136 (surface-induced dissociation)

e.g.: MS:1000242 (blackbody infrared radiative dissociation) e.g.: MS:1000250 (electron capture dissociation) e.g.: MS:1000262 (infrared multiphoton dissociation) e.g.: MS:1000282 (sustained off-resonance irradiation)
e.g.: MS:1000422 (high-energy collision-induced dissociation) e.g.: MS:1000433 (low-energy collision-induced dissociation)

et al.

<cvParam cvRef="MS" accession="MS:1000133" name="collision-induced dissociation"

Example cvParams:

<cvParam cvRef="MS" accession="MS:1000045" name="collision energy" value="35"</pre>

unitCvRef="UO" unitAccession="UO:0000266" unitName="electronvolt"/>
<cvParam cvRef="MS" accession="MS:1000044" name="dissociation method"/>

4.18 Element <scanWindow>

Definition: A range of m/z values over which the instrument scans and aquires a spectrum.

Type: dx:ParamGroupType

Attributes: none

Subelement Name	min	max	Definition
referenceableParamGroupRef	0	unlim	A reference to a previously defined ParamGroup, which is a reusable container of one or more cvParams.
<u>cvParam</u>	0	unlim	This element holds additional data or annotation. Only controlled values are allowed here.

Subelements:

<u>userParam</u>	0	unlim	Uncontrolled user parameters (essentially allowing free text). Before using these, one should verify whether there is an appropriate CV term available, and if so, use the CV term instead
------------------	---	-------	--

cvParam cvRef="MS" accession="MS:1000501" name="scan window lower limit" value="400"

Example unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>

Context: <cvParam cvRef="MS" accession="MS:1000500" name="scan window upper limit" value="1600"</pre>

unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>

</scanWindow>

Path scanList/scan/scanWindowList/scanWindow

cvParam Mapping

MAY supply a *child* term of MS:1000549 (selection window attribute) one or more times

e.g.: MS:1000500 (scan window upper limit) e.g.: MS:1000501 (scan window lower limit)

Rules: MUST supply term MS:1000500 (scan window upper limit) only once MUST supply term MS:1000501 (scan window lower limit) only once

Example cvParams: <cvParam cvRef="MS" accession="MS:1000501" name="scan window lower limit" value="400"</pre> unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>

<cvParam cvRef="MS" accession="MS:1000500" name="scan window upper limit" value="1800"</pre>

unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/>

4.19 Element <selectedlon>

Structure allowing the use of a controlled (cvParam) or uncontrolled vocabulary **Definition:**

(userParam), or a reference to a predefined set of these in this mzML file

(paramGroupRef).

Type: dx:ParamGroupType

Attributes: none

Subelement Name	min	max	Definition
referenceableParamGroupRef	0	unlim	A reference to a previously defined ParamGroup, which is a reusable container of one or more cvParams.
<u>cvParam</u>	0	unlim	This element holds additional data or annotation. Only controlled values are allowed here.
<u>userParam</u>	0	unlim	Uncontrolled user parameters (essentially allowing free text). Before using these, one should verify whether there is an appropriate CV term available, and if so, use the CV term instead

Subelements:

Example

Context:

<selectedIon>

<cvParam cvRef="MS" accession="MS:1000744" name="selected ion m/z"</pre>

value="1082.5037" unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/> <cvParam cvRef="MS" accession="MS:1000633" name="possible charge state"

value="2"/> <cvParam cvRef="MS" accession="MS:1000633" name="possible charge state"</pre> value="3"/>

</selectedIon>

Path precursorList/precursor/selectedIonList/selectedIon

cvParam MUST supply a *child* term of MS:1000455 (ion selection attribute) one or more times

e.g.: MS:1000041 (charge state) Mapping e.g.: MS:1000042 (intensity) Rules: e.g.: MS:1000633 (possible charge state)

e.g.: MS:1000744 (selected ion m/z)

<cvParam cvRef="MS" accession="MS:1000744" name="selected ion m/z"
value="445.339999999997" unitCvRef="MS" unitAccession="MS:1000040" unitName="m/z"/> Example cvParam cvRef="MS" accession="MS:1000042" name="intensity" value="120053"/>
cvParam cvRef="MS" accession="MS:1000041" name="charge state" value="2"/> cvParams: <cvParam cvRef="MS" accession="MS:1000633" name="possible charge state" value="2"/>

5. Conclusions

This document contains the specifications for using the mzDB format to represent mass spectrometry results, metadata and associated context. This specification, in conjunction with the SQL and XML schemata constitute a proposal for a standard from the Proteomics French Infrastructure.
